New mechanisms on global scale

As a subject of discussion we propose to consider the idea of creation of an international corporation of innovative development.

Corporation of innovative development will create national and international innovation hubs (“innovative islands”) around the world, first of all in the developing countries based on the combination of technology transfer and implementation of scientific and applied achievements of these countries. Technologies of fifth and sixth technological modes are the key priorities that allow eliminate technological threats, improve the quality of medical

services, solve energy and food problems, significantly reduce unit production costs, and economy growth in general.

Financing of innovative programs and projects will be mainly on non-credit basis, using investment vehicles and instruments. This “Innovative consensus” allows recovering the initial costs as well as reinvesting in new projects of sustainable development. Main mission of the Corporation is to stimulate innovative activity and promote growth of innovative products, changes in GDP structure from resource-based in favor of high-tech economy, improve public health and life expectancy of people globally.
